Department of Computer Science and Engineering

VISION OF THE INSTITUTE

To continually develop excellent professionals capable of providing sustainable solutions to challenging problems in their fields and prove responsible global citizens.

MISSION OF THE INSTITUTE

We wish to serve the nation by becoming a reputed deemed university for providing value based professional education.

VISION OF THE DEPARTMENT

To be recognized globally for delivering high quality education in the ever changing field of computer science & engineering, both of value & relevance to the communities we serve.

MISSION OF THE DEPARTMENT

1. To provide quality education in both the theoretical and applied foundations of Computer Science and train students to effectively apply this education to solve realworldproblems.
2. Toamplifytheir potentialfor lifelonghighqualitycareersandgivethemacompetitive advantage in the challenging global workenvironment.

PROGRAM EDUCATIONAL OUTCOMES (PEOs)

PEO 1: Learning: Our graduates to be competent with sound knowledge in field of Computer Science &Engineering.

PEO 2: Employable: To develop the ability among students to synthesize data and technical concepts for application to software product Design for successful careers that meet the needs of Indian and multinationalcompanies.

PEO 3: Innovative: To develop research oriented analytical ability among students to prepare them for making technical contribution to thesociety.

PEO 4: Entrepreneur / Contribution: To develop excellent leadership quality among students which they can use at different levels according to their experience and contribute for progress and development in the society.

PROGRAM OUTCOMES(POs)

Engineering Graduates will be able to:

PO1: Engineering knowledge: Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.

PO2: Problem analysis: Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.

PO3: Design/development of solutions: Design solutions for complex engineering problems and Design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.

PO4: Conduct investigations of complex problems: Use research-based knowledge and research methods including Design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

PO5: Modern tool usage: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modelling to complex engineering activities with an understanding of the limitations.

PO6: The engineer and society: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.

PO7: Environment and sustainability: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.

PO8: Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.

PO9: Individual and team work: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.

PO10: Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to

comprehend and write effective reports and Design documentation, make effective presentations, and give and receive clear instructions.

PO11: Project management and finance: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.

PO12: Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

PROGRAM SPECIFIC OUTCOMES (PSOs)

PSO1: The ability to use standard practices and suitable programming environment to develop software solutions.

PSO2: The ability to employ latest computer languages and platforms in creating innovative career opportunities.

COURSE OUTCOMES (COs)

C308.1	Identify patterns, tokens & regular expressions for lexical analysis.
C308.2	Design Lexical analyser for given language using C and LEX /YACC tools
C308.3	Design and analyze top down and bottom up parsers.
C308.4	Generate the intermediate code
C308.5	Generate machine code from the intermediate code forms.

CO-PO MAPPING

	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12
C308.1	3	3	2	3					2

C308.3	3	2
C308.4	3	2
C308.5	3	2

Sr. No.	Title of Experiment	Corresponding CO
1	Design and implement a lexical analyzer for given language using C and the lexical analyzer should ignore redundant spaces, tabs and new lines.	C308.1
2	Implementation of Lexical Analyzer using Lex Tool	C308.2
3	Generate YACC specification for a few syntactic categories. a) Program to recognize a valid arithmetic expression that uses operator +, -, * and /. b) Program to recognize a valid variable which starts with a letter followed by any number of letters or digits. c) Implementation of Calculator using LEX and YACC d) Convert the BNF rules into YACC form and write code to generate abstract syntax tree	C308.2
4	Write program to find ϵ – closure of all states of any given NFA with ϵ transition.	C308.1
5	Write program to convert NFA with ϵ transition to NFA without ϵ transition.	C308.1
6	Write program to convert NFA to DFA	C308.1
7	Write program to minimize any given DFA.	C308.1
8	Construct a Shift Reduce Parser for a given language.	C308.3
9	Write program to find Simulate First and Follow of any given grammar.	C308.3
10	Construct a recursive descent parser for an expression.	C308.3
11	Develop an operator precedence parser for a given language.	C308.3
12	Write a program to perform loop unrolling.	C308.5
13	Write a program to perform constant propagation.	C308.5
14	Implement Intermediate code generation for simple expressions.	C308.4
15	Implement the back end of the compiler which takes the three address code and produces the 8086 assembly language instructions that can be assembled and run using an 8086 assembler. The target assembly instructions can be simple move, add, sub, jump etc.	C308.4
CONTENT BEYOND SYLLABUS		

16	Write a C program for constructing of LL (1) parsing.	C308.3
17	Write a program to Design LALR Bottom up Parser.	C308.3

INTRODUCTION

The language Processors comprises assemblers, compilers and interpreters. It deals with the recognition the translation, and the execution of formal languages It is closely related to compiler construction. Compiler is system software that converts high level language into low level language. We human beings can't program in machine language (low level lang.) understood by computers so we program in high level language and compiler is the software which bridges the gap between user and computer.

Students will gain the knowledge of

- Lexical Analysis for decomposing a character stream into lexical units
- Syntax analysis for recovering context-free structure from an input stream, error correction
- Semantic analysis for enforcing non-context-free requirements, attribute grammars.
 - Semantic definition, for describing the meaning of a phrase (we rely on interpreted definitions)
- Implementation of programming concepts, control structures
- Data representation, implementation of data structures
- Partial evaluation, for removing interpretation overhead
- Code generation: instruction selection, register allocation
- Further semantic analysis: document validation , type checking.

PREFACE

This lab is as a part of B.Tech. VI semester for CSE students. Compiler Design principles provide an in-depth view of translation and optimization process. This lab enables the students to practice basic translation mechanism by Designing complete translator for a mini language and error detection & recovery. It includes lexical, syntax, and semantic analysis as front end, and code generation and optimization as back-end with recommended systems/software requirements following the university prescribed textbooks. The expected outcomes from the students are:

1. By this laboratory, students will understand the practical approach of how a compiler works.
2. This will enable him to work in the development phase of new computer languages in industry.

We extend our sincere thanks to Department of Computer Science and Engineering, R.K.G.I.T., Ghaziabad, for giving us this opportunity to prepare a Compiler Design Lab .

Ms. Rinki Tyagi
Assistant Professor
Dept. of CSE

DO'S AND DONT'S

DO's

1. Conform to the academic discipline of the department.
2. Enter your credentials in the laboratory attendance register.
3. Read and understand how to carry out an activity thoroughly before coming to the laboratory.
4. Ensure the uniqueness with respect to the methodology adopted for carrying out the experiments.
5. Shut down the machine once you are done using it.

DONT'S

1. Eatables are not allowed in the laboratory.
2. Usage of mobile phones is strictly prohibited.
3. Do not open the system unit casing.
4. Do not remove anything from the computer laboratory without permission.
5. Do not touch, connect or disconnect any plug or cable without your faculty/laboratory technician's permission.

GENERAL SAFETY INSTRUCTIONS

1. Know the location of the fire extinguisher and the first aid box and how to use them in case of an emergency.
2. Report fire or accidents to your faculty /laboratory technician immediately.
3. Report any broken plugs or exposed electrical wires to your faculty/laboratory technician immediately.
4. Do not plug in external devices without scanning them for computer viruses.

GUIDELINES FOR LABORTORY RECORDPREPARATION

While preparing the lab records, the student is required to adhere to the following guidelines:

Contents to be included in Lab Records:

1. Coverpage
2. Vision
3. Mission
4. PEOs
5. POs
6. PSOs
7. COs
8. CO-PO-PSO mapping
9. Inde
- x 10.

Experiments

- Aim
- Sourcecode
- Input-Output

A separate copy needs to be maintained for pre-lab written work.

The student is required to make the Lab File as per the format given on the next two pages.

Raj Kumar Goel Institute of Technology, Ghaziabad

COMPILER Design LAB FILE (KCS 552)

INDEX

Experiment No.	Experiment Name	Date of Conductio n	Date of Submissio n	Faculty Signatur e

GUIDELINES FOR ASSESSMENT

Students are provided with the details of the experiment (Aim, pre-experimental questions, procedure etc.) to be conducted in next lab and are expected to come prepared for each lab class. Faculty ensures that students have completed the required pre-experiment questions and they complete the in-lab programming assignment(s) before the end of class. Given that the lab programs are meant to be formative in nature, students can ask faculty for help before and during the lab class.

Students' performance will be assessed in each lab based on the following Lab Assessment Components:

Assessment Criteria-1: Performance (Max. marks = 5)

Assessment Criteria-2: VIVA (Max. marks = 5)

Assessment Criteria-3: Record (Max. marks = 5)

In each lab class, students will be awarded marks out of 5 under each component head, making it total out of 15 marks.

EXPERIMENT#1

Aim: Design and implement a lexical analyzer for given language using C and the lexical analyzer should ignore redundant spaces, tabs and new lines.

Description:

Lexical analysis or scanning is the process where the stream of characters making up the source program is read from left-to-right and grouped into tokens. Tokens are sequences of characters with a collective meaning. There are usually only a small number of tokens for a programming language: constants (integer, double, char, string, etc.), operators (arithmetic, relational, logical), punctuation, and reserved words.

PROGRAM CODE:

```
#include<stdio.h>
#include<conio.h>
#include<ctype.h>
#include<string.h>
void keyword( char str[10])
{
    if(strcmp("for",str)==0 || strcmp("while",str)==0 || strcmp("do",str)==0 || strcmp("int",str)==0 ||
    strcmp("float",str)==0 || strcmp("char",str)==0 || strcmp("double",str)==0 || strcmp("static", str)==0 ||
    strcmp("switch",str)==0 || strcmp("case",str)==0) printf("\n %s is a key word", str);
    else
    printf("\n %s is an identifier",str);
}
main()
{
```

```
FILE *f1,*f2,*f3;
char c,str[10],st1[10];
int num[100], lineno=0, tokenvalue=0,i=0,j=0,k=0;
printf("\nEnter the program");
f1=fopen("input", "w");
```

```
while((c=getchar())!=EOF)
```

Department of Computer Science & Engineering

```
putc(c,f1);
fclose(f1);
f1=fopen("input","r");
f2=fopen("identifier","w");
f3=fopen("specialchar","w");
while((c=getc(f1))!=EOF)
{
    if(isdigit(c))
    {
tokenvalue=c-'0';
c=getc(f1);
        while(isdigit(c)) {
            tokenvalue*=10+c-'0';
            c=getc(f1);
        }
num[i++]=tokenvalue;
ungetc(c,f1);
    }
    elseif(isalpha(c))
    {
putc(c,f2);
c=getc(f1);
        while(isdigit(c) || isalpha(c) || c=='_' || c=='$')
        {
putc(c,f2);
c=getc(f1);
        }
        putc(' ',f2);
        ungetc(c,f1);
    }
    elseif(c==' ' || c=='\t')
        printf(" ");
    else
    if(c=='\n')
        lineno++;
    else
        putc(c,f3);
}
fclose(f2);
fclose(f3);
fclose(f1);
printf("\nThe no's in the program are");
for(j=0;j<i;j++)
printf("%d",num[j]);
printf("\n");
f2=fopen("identifier","r");
```

Department of Computer Science & Engineering

```
k=0;
printf("The keywords and identifiers are:");
while((c=getc(f2))!=EOF){
    if(c!=' ')
        str[k++]=c;
    else
    {
        str[k]='\0';
        keyword(str);
        k=0;
    }
}
fclose(f2);
f3=fopen("specialchar","r");
    printf("\nSpecial characters are");
    while((c=getc(f3))!=EOF)
        printf("%c",c);
printf("\n");
fclose(f3);

printf("Total no. of lines are:%d",lineno);
}
```

INPUT:

Enter Program \$ for termination:

```
{
int a[3],t1,t2;
t1=2; a[0]=1; a[1]=2; a[t1]=3;
t2=-(a[2]+t1*6)/(a[2]-t1);
if t2>5 then
print(t2);
else {
int t3;
t3=99;
t2=-25;
print(-t1+t2*t3); /* this is a comment on 2 lines */
} endif
}
```

OUTPUT:

Variables :a[3]t1 t2 t3

Operator : - + * / >

Constants : 2 1 3 6 5 99 -25

Keywords : int if then else endif

Special Symbols : , ; () { }

EXPERIMENT #2

Aim: To write a c program for implementing a lexical analyzer using LEX tool

ALGORITHM:

Step1: Lex program contains three sections: definitions, rules, and user subroutines. Each section must be separated from the others by a line containing only the delimiter, `%%`. The format is as follows: definitions `%%` rules `%%` user_subroutines

Step2: In definition section, the variables make up the left column, and their definitions make up the right column. Any C statements should be enclosed in `%{..}%`. Identifier is defined such that the first letter of an identifier is alphabet and remaining letters are alphanumeric.

Step3: In rules section, the left column contains the pattern to be recognized in an input file to `yylex()`. The right column contains the C program fragment executed when that pattern is recognized. The various patterns are keywords, operators, new line character, number, string, identifier, beginning and end of block, comment statements, preprocessor directive statements etc.

Step4: Each pattern may have a corresponding action, that is, a fragment of C source code to execute when the pattern is matched.

Step5: When `yylex()` matches a string in the input stream, it copies the matched text to an external character array, `ytext`, before it executes any actions in the rules section.

Step6: In user subroutine section, main routine calls `yylex()`. `yywrap()` is used to get more input.

Step7: The lex command uses the rules and actions contained in file to generate a program, `lex.yy.c`,

Department of Computer Science & Engineering

which can be compiled with the cc command. That program can then receive input, break the input into the logical pieces defined by the rules in file, and run program fragments contained in the actions in file.

PROGRAM CODE:

```
//Implementation of Lexical Analyzer using Lex tool
%{
    int COMMENT=0;
    %}
    identifier [a-zA-Z][a-zA-Z0-9]*
    %%
    #.* {printf("\n%s is a preprocessor directive",yytext);}

EXPERIMENT #3

Aim: Generate YACC specification for a few syntactic categories:

- Program to recognize a valid arithmetic expression that uses operator +, -, *, and /.
- Program to recognize a valid variable which starts with a letter followed by any number of letters or digits.
- Implementation of Calculator using LEX and YACC
- Convert the BNF rules into YACC form and write code to generate abstract syntax tree

Description:

A parser generator is a program that takes as input a specification of a syntax, and produces as output a procedure for recognizing that language. Historically, they are also called compiler-compilers.

Department of Computer Science & Engineering

YACC (yet another compiler-compiler) is an LALR(1) (LookAhead, Left-to-right, Rightmost derivation producer with 1 lookahead token) parser generator. YACC was originally Designed for being complemented by Lex.

For Compiling YACC Program:

Write lex program in a file file.l and yacc in a file file.y

Open Terminal and Navigate to the Directory where you have saved the files.

type lex file.l

type yacc file.y

type cc lex.yy.c y.tab.h -ll

type ./a.out

a) Program to recognize a valid arithmetic expression that uses operator +, -, *, and /.

Program name:arith_id.l

```
% {  
/* This LEX program returns the tokens for the expression */  
#include "y.tab.h"  
% }
```

```
%%  
"=" {printf("\n Operator is EQUAL");}  
"+" {printf("\n Operator is PLUS");}  
"- " {printf("\n Operator is MINUS");}  
"/" {printf("\n Operator is DIVISION");}  
"*" {printf("\n Operator is MULTIPLICATION");}
```

```
[a-z A-Z]*[0-9]* {  
printf("\n Identifier is %s",yytext);  
return ID;  
}  
return yytext[0];  
\n return 0;  
%%
```

```
int yywrap()  
{  
return 1;  
}
```

Program Name : arith_id.

```
% {  
#include  
/* This YYAC program is for recognizing the Expression */  
% }  
%%  
statement: A='E'  
| E {  
printf("\n Valid arithmetic expression");
```

Department of Computer Science & Engineering

```
$$ = $1;
};

E: E '+' ID
| E '-' ID
| E '*' ID

sin 45/mem
Answer = 1
```

```
ln 10
Answer = 2.
```

EXPERIMENT #4

Aim: Write program to find ϵ – closure of all states of any given NFA with ϵ transition.

Description:

A nondeterministic finite automaton (NFA), or nondeterministic finite state machine, does not need to obey these restrictions. In particular, every DFA is also an NFA.

Using the subset construction algorithm, each NFA can be translated to an equivalent DFA, i.e. a DFA recognizing the same formal language. Like DFAs, NFAs only recognize regular languages. Sometimes the term NFA is used in a narrower sense, meaning an automaton that properly violates an above restriction i.e. that is *not* a DFA.

ALGORITHM:

Step1: Start the Program.

Step2: Enter the regular expression R over alphabet E.

Step3: Decompose the regular expression R into its primitive components

Step4: For each component construct finite automata.

Step5: To construct components for the basic regular expression way that corresponding to that way compound regular expression.

Step6: Stop the Program

PROGRAM :

```
// Program to find epsilon closure of a given NFA
```

```
#include<stdio.h>
```

Department of Computer Science & Engineering

```
#include<string.h>
```

```
char result[20][20],copy[3],states[20][20];
void add_state(char a[3],int i){
strcpy(result[i],a);
}
void display(int n){
int k=0;
printf("nnn Epsilon closure of %s = { ",copy);
while(k < n){
printf(" %s",result[k]);
k++;
}
printf(" } nnn");
}
int main(){
FILE *INPUT;
INPUT=fopen("input.dat","r");
char state[3];
int end,i=0,n,k=0;
char state1[3],input[3],state2[3];
printf("\n Enter the no of states: ");
scanf("%d",&n);
printf("\n Enter the states n");
for(k=0;k<3;k++){
scanf("%s",states[k]);
```

```
}

for( k=0;k<n;k++){
i=0;
strcpy(state,states[k]);
strcpy(copy,state);
add_state(state,i++);
while(1){
end = fscanf(INPUT,"%s%s%s",state1,input,state2);
if (end == EOF ){
break;
```

```
if( strcmp(state,state1) == 0 ){
if( strcmp(input,"e") == 0 ) {
add_state(state2,i++);
```

```
strcpy(state, state2);
}
}
```

Department of Computer Science & Engineering

```
    }  
display(i);  
    rewind(INPUT);  
}  
  
return 0;  
}
```

INPUT& OUTPUT:

```
q0 0 q0  
q0 1 q1  
q0 e q1  
q1 1 q2  
q1 e q2
```

Enter the no of states: 3

Enter the states

```
q0  
q1  
q2
```

```
Epsilon closure of q0 = { q0 q1 q2 }  
Epsilon closure of q1 = { q1 q2 }  
Epsilon closure of q2 = { q2 }
```

EXPERIMENT #5

Aim: Write program to convert NFA with ϵ transition to NFA without ϵ transition.

PROGRAM CODE:

```

EXPERIMENT #6

Aim: Write program to convert NFA to DFA

Description:

Step1: $q_0=2^0=1$, $q_1=2^1=2$, $q_2=2^2=4$

Step2: Similarly union of states will be represented as:

$q_0q_1=2^0+2^1=3$, $q_1q_2=2^1+2^2=6$, $q_0q_1q_2=2^0+2^1+2^2=7$

Step3: Do not give any condition for “phi”.....

That case is not handled.....(Coz I M LAZY:P)

Step4: Follow zero based indexing everywhere

Step5: Program assumes that if “Number of states are=n” then they are numbered as $q_0, q_1, q_2, \dots, q_{(n-1)}$

Step6: If you find any bug, message me and forgive me for the error.

Program :

```
#include<string.h>
#include<stdio.h>
#include<math.h>

int ninputs;
int dfa[100][2][100] = {0};
int state[10000] = {0};

EXPERIMENT #7

Aim: Write program to minimize any given DFA.

ALGORITHM:

Suppose there is a DFA $D = \langle Q, \Sigma, q_0, \delta, F \rangle$ which recognizes a language L . Then the minimized DFA $D' = \langle Q', \Sigma, q_0', \delta', F' \rangle$ can be constructed for language L as:

Step 1: We will divide Q (set of states) into two sets. One set will contain all final states and other set will contain non-final states. This partition is called P_0 .

Step 2: Initialize $k = 1$

Step 3: Find P_k by partitioning the different sets of P_{k-1} . In each set of P_{k-1} , we will take all possible pair of states. If two states of a set are distinguishable, we will split the sets into different sets in P_k .

Step 4: Stop when $P_k = P_{k-1}$ (No change in partition)

Step 5: All states of one set are merged into one. No. of states in minimized DFA will be equal to no. of sets in P_k .

PROGRAM :

```
#include <stdlib.h>
#include <string.h>
#include <stdio.h>

int **transitionMap; // 2D array which is used to store state transitions. transitionMap[i][j] is the state
reached when state i is given symbol j
int **partitionTransitionMap; // same as transitionMap, except row indices represent partition
numbers,
not state numbers
```

Department of Computer Science & Engineering

```
int startState; // The starting state. This is used as the root for DFS to eliminate unreachable states

EXPERIMENT #8

Aim : Implementation of shift reduce parsing algorithm.

Description:

Shift-reduce parsing attempts to construct a parse tree for an input string beginning at the leaves and working up towards the root. In other words, it is a process of “reducing” (opposite of deriving a symbol using a production rule) a string w to the start symbol of a grammar.

ALGORITHM:

Department of Computer Science & Engineering

STEP1: Initial State: the stack consists of the single state, s0; ip points to the first character in w.

STEP 2: For top-of-stack symbol, s, and next input symbol, a case action of T[s,a]

STEP 3: **shift x**: (x is a STATE number) push a, then x on the top of the stack and advance ip to point to the next input symbol.

STEP 4: **reduce y**: (y is a PRODUCTION number) Assume that the production is of the form $A \Rightarrow \beta$ pop $2 * |\beta|$ symbols of the stack.

STEP 5: At this point the top of the stack should be a state number, say s'. push A, then goto of T[s',A] (a state number) on the top of the stack.

PROGRAM CODE:

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
int k=0,z=0,i=0,j=0,c=0;
char a[16],ac[20],stk[15],act[10];
void check();

EXPERIMENT #10

Aim: Construction of recursive descent parsing for the following grammar

$E \rightarrow TE'$

$E' \rightarrow +TE' \mid -TE' \mid \text{null}$

$T \rightarrow FT'$

$T' \rightarrow *FT' \mid /FT' \mid \text{null}$

$F \rightarrow \text{id} \mid (E) \mid \text{num}$

Description:

Recursive descent is a top-down parsing technique that constructs the parse tree from the top and the input is read from left to right. It uses procedures for every terminal and non-terminal entity. This parsing technique recursively parses the input to make a parse tree, which may or may not require back-tracking. But the grammar associated with it (if not left factored) cannot avoid back-tracking. A form of recursive-descent parsing that does not require any back-tracking is known as predictive parsing.

Department of Computer Science & Engineering

ALGORITHM:

Step1:start.

Step2:Declare the prototype functions E(),EP(),T(),TP(),F() Step3:

Read the string to be parsed.

Step 4: Check the productions

Step 5: Compare the terminals and Non-terminals

Step 6: Read the parse string

Step 7: stop the production

PROGRAM CODE:

```

T'->null  
E'->null
```

EXPERIMENT #11

Aim: - Write a C program to implement operator precedence parsing

Department of Computer Science & Engineering

Description:

An operator precedence grammar is a context-free grammar that has the property (among others) that no production has either an empty right-hand side or two adjacent nonterminals in its right-hand side. These properties allow precedence relations to be defined between the terminals of the grammar. A parser that exploits these relations is considerably simpler than more general-purpose parsers such as LALR parsers. Operator-precedence parsers can be constructed for a large class of context-free grammars.

ALGORITHM:

Step 1: Push # onto stack

Step 2: Read first input symbol and push it onto stack

Step 3: Do

Obtain OP relation between the top terminal symbol on the stack and the next input symbol. If the OP relation is $<$ or $=$

i. Pop top of the stack into handle, include non-terminal symbol if appropriate.

ii. Obtain the relation between the top terminal symbol on the stack and the leftmost terminal symbol in the handle.

iii. While the OP relation between terminal symbols is $=$ do

- Pop top terminal symbol and associated non-terminal symbol on stack into handle

iv. Match the handle against the RHS of all productions v. Push N onto the stack

Step 4: Until end-of-file and only # and N are on the stack

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
void main(){
/*OPERATOR PRECEDENCE PARSER*/
char stack[20],ip[20],opt[10][10][1],ter[10];
```

```
int i,j,k,n,top=0,col,row;
clrscr();
for(i=0;i<10;i++){
{
```

Department of Computer Science & Engineering

```
stack[i]=NULL;
ip[i]=NULL;
for(j=0;j<10;j++)
{
opt[i][j][1]=NULL;
}
}
printf("Enter the no.of terminals :\n");
scanf("%d",&n);
printf("\nEnter the terminals :\n");
scanf("%s",&ter);
printf("\nEnter the table values :\n");
for(i=0;i<n;i++)
{
for(j=0;j<n;j++)
{
printf("Enter the value for %c %c:",ter[i],ter[j]);
scanf("%s",opt[i][j]);
}
}
printf("\n***** OPERATOR PRECEDENCE TABLE *****\n");

for(i=0;i<n;i++)
{
printf("\t%c",ter[i]);
}
printf("\n");
for(i=0;i<n;i++){printf("\n%c",ter[i]);
for(j=0;j<n;j++){printf("\t%c",opt[i][j][0]);} }
stack[top]='$';
```

Department of Computer Science & Engineering

```
printf("\nEnter the input string:");
scanf("%s",ip);
i=0;
```

```
printf("\nSTACK\t\t\tINPUT\t\t\tACTION\n");
```

```
printf("\n%s\t\t\t%s\t\t\t",stack,ip);

EXPERIMENT #12

Aim: Write a program to perform loop unrolling.

Description:

Loop unrolling is a loop transformation technique that helps to optimize the execution time of a program. We basically remove or reduce iterations. Loop unrolling increases the program's speed by eliminating loop control instruction and loop test instructions.

PREEXPERIMENT

Q1. Define loop unrolling

Q2. Give example of loop unrolling

ALGORITHM:

Step1: Start

Step2: Declare n

Step3: Enter n value

Step4: Loop rolling display countbit1 or move to next step 5

Step5: Loop unrolling display countbit2

Step6: End

PROGRAM:

Program 1:

Department of Computer Science & Engineering

```
// This program does not uses loop unrolling.
#include<stdio.h>

int main(void)
{
for (int i=0; i<5; i++)
printf("Hello\n"); //print hello 5 times
return 0;
}
```

Program 2:

```
// This program uses loop unrolling.
#include<stdio.h>
int main(void)
{
// unrolled the for loop in program 1
printf("Hello\n");
printf("Hello\n");
printf("Hello\n");
printf("Hello\n");
printf("Hello\n");
return 0;
}
```

Output:

```
Hello
Hello
Hello
Hello
Hello
```

Illustration:

Program 2 is more efficient than program 1 because in program 1 there is a need to check the value of *i* and increment the value of *i* every time round the loop. So small loops like this or loops where there is fixed number of iterations are involved can be unrolled completely to reduce the loop overhead.

EXPERIMENT #13

Aim: Write a Program to implement Code Optimization Techniques (eg. Constant propagation etc)

Description:

The algorithm we shall present basically tries to find for every statement in the program a mapping between variables, and values of $N \cup T \cup \perp$. If a variable is mapped to a constant number, that number is the variables value in that statement on every execution. If a variable is mapped to T (top), its value in the statement is not known to be constant, and in the variable is mapped to \perp (bottom), its value is not initialized on every execution, or the statement is unreachable. The algorithm for assigning the mappings to the statements is an iterative algorithm, that traverses the control flow graph of the algorithm, and updates each mapping according to the mapping of the previous statement, and the functionality of the statement. The traversal is iterative, because non-trivial programs have circles in their control flow graphs, and it ends when a “fixed-point” is reached – i.e., further iterations don’t change the mappings.

ALGORITHM:

- Step1: Start
- Step2: Create an input file which contains three address code
- Step3: Open the file in read mode
- Step4: If the file pointer returns NULL, exit the program else goto 5

Department of Computer Science & Engineering

Step5: Scan the input symbol from left to right.

Common sub-expression elimination.

Step6: Store the first expression in a string.

Step7: Compare the string with the other expressions in the file.

Step8: If there is a match, remove the expression from the input file.

Step9: Perform the step 5 to 8 for all the input symbols in the file.

Dead Code Elimination

Step10: Scan the input symbol from the file from left to right.

Step11: Get the operand before the operator from the three address code.

Step12: Check whether the operand is used in any other expression in the three address code.

Step13: If the operand is not used, then eliminate the complete expression from the three address code else goto 14.

Step14: Perform step 11-13 for all the operands in the three address code till end of file is reached.

Step15: Stop.

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
struct op{
char l;
char r[20];
}

op[10], pr[10];
void main()
{
int a,i,k,j,n,z=0,m,q;
char *p, *l;
char temp,t;
char *temp;
clrscr();
printf("Enter the no. of values");
scanf("%d", &n);
for(i=0;i<n;i++)
{
printf("\tleft\t");
op[i].l=getche();
printf("\tright:\t");
scanf("%s",op[i].r);

EXPERIMENT # 15

Aim: Implement the back end of the compiler which takes the three address code and produces the 8086 assembly language instructions that can be assembled and run using an 8086 assembler. The target assembly instructions can be simple move, add, sub, jump etc.

Department of Computer Science & Engineering

ALGORITHM:

- i. Start the program.
- ii. Get the three variables from statements and stored in the text file k.txt
- iii. Compile the program and give the path of text file.
- iv. Execute the program
- v. Target code for the given statement was produced.
- vi. Stop the program.

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
void main()
char icode[10][30], str[20], opr[10];
int i=10;
clrscr();
printf("\n Enter the set of intermediate code(terminated by exit):\n");
do
{
scanf("%s", icode[i]);
} while(strcmp(icode[i++], "exit")!=0);
printf("\n target code generation");
printf("\n*****");
i=0;
do{
strcpy(str,icode[i]);
switch(str[3]){
case '+':
strcpy(opr,"ADD");
break;
case '-':
strcpy(opr,"SUB");
break;
case '*':
strcpy(opr, "MUL");
break;

EXPERIMENT #16

Aim: Write a C program for constructing of LL (1) parsing.

Description:

An LL parser is a top-down parser for a subset of context-free languages. It parses the input from Left to right, performing Leftmost derivation of the sentence. An LL parser is called an $LL(k)$ parser if it uses k tokens of look-ahead when parsing a sentence. If such a parser exists for a certain grammar and it can parse sentences of this grammar without backtracking then it is called an $LL(k)$ grammar. $LL(k)$ grammars can generate more languages the higher the number k of lookahead tokens.

ALGORITHM:

Step1: If $A \rightarrow \alpha$ is a production choice, and there is a derivation $\alpha \Rightarrow^* a\beta$, where a is a token, then we add $A \rightarrow \alpha$ to the table entry $M[A, a]$.

Step 2: If $A \rightarrow \alpha$ is a production choice, and there are derivations $\alpha \Rightarrow^* \varepsilon$ and $SS \Rightarrow^* \beta A a \gamma$, where S is the start symbol and a is a token (or $\$$), then we add $A \rightarrow \alpha$ to the table entry $M[A, a]$

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
char s[20],stack[20];
void main()
{
char m[5][6][3]={ "tb"," "," ","tb"," "," "," "+tb," "," ","n","n","fc"," "," ","fc"," "," "," ","n","*fc"," a
","n","n","i"," "," ","(e)"," "," "};
int size[5][6]={ 2,0,0,2,0,0,3,0,0,1,1,2,0,0,2,0,0,0,1,3,0,1,1,1,0,0,3,0,0};
int i,j,k,n,str1,str2;
clrscr();
printf("\n Enter the input string: ");
scanf("%s",s);
strcat(s,"$");
n=strlen(s);
stack[0]='$';
stack[1]='e';
```

Department of Computer Science & Engineering

```
i=1;
j=0;

EXPERIMENT #17

Aim: - Write a program to Design LALR Bottom up Parser.

Description:

An LALR parser or Look-Ahead LR parser is a simplified version of a canonical LR parser, to parse (separate and analyze) a text according to a set of production rules specified by a formal grammar for a computer language. ("LR" means left-to-right, rightmost derivation.)

- Works on intermediate size of grammar
- Number of states are same as in SLR(1)

ALGORITHM:

STEP1: Represent I by its CLOSURE, those items that are either the initial item $[S']$ or do not have the \cdot at the left end of the RHS

STEP2: Compute shift, reduce, and goto actions for the state derived from I directly from CLOSURE(I)

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
#include<stdlib.h>
#include<string.h>

void push(char *,int *,char);
char stacktop(char *);
void isproduct(char,char);
int ister(char);
int isnter(char);
int isstate(char);
void error();
void isreduce(char,char);
char pop(char *,int *,char);
void printt(char *,int *,char [],int);
void rep(char [],int);
```

APPENDIX-I:

Department of Computer Science & Engineering
SYLLABUS (AS PER AKTU)

1. Design and implement a lexical analyzer for given language using C and the lexical analyzer should ignore redundant spaces, tabs and new lines.
2. To write a c program for implementing a lexical analyzer using LEX tool
3. Generate YACC specification for a few syntactic categories:
 - a) Program to recognize a valid arithmetic expression that uses operator +, −, * and /.
 - b) Program to recognize a valid variable which starts with a letter followed by any number of letters or digits.
 - c) Implementation of Calculator using LEX and YACC
 - d) Convert the BNF rules into YACC form and write code to generate abstract syntax tree
4. Write program to find ϵ – closure of all states of any given NFA with ϵ transition.
5. Write program to convert NFA with ϵ transition to NFA without ϵ transition.
6. Write program to convert NFA to DFA
7. Write program to minimize any given DFA.
8. Implementation of shift reduce parsing algorithm.
9. Write program to find Simulate First and Follow of any given grammar.
10. Construction of recursive descent parsing for the following grammar
11. Write a C program to implement operator precedence parsing
12. Write a program to perform loop unrolling.
13. Write a Program to implement Code Optimization Techniques (eg. Constant propagation etc)
14. Implement Intermediate code generation for simple expressions.
15. Implement the back end of the compiler which takes the three address code and produces the 8086 assembly language instructions that can be assembled and run using an 8086 assembler. The target assembly instructions can be simple move, add, sub, jump etc.
16. Write a C program for constructing of LL (1) parsing.
17. Write a program to Design LALR Bottom up Parser.
